

Trackers or Fixed ?

[SolarShare](#), Canada's largest solar co-op, uses [SolarVu](#) on all their sites to maximize performance and up time with optimum maintenance. This ensures that they will achieve their target financial returns that support their [solar bonds](#), which pay 5% annually for 5 years or 6% for 15 years, providing retail investors much better safe returns than a GIC. With declining FIT rates for each new project, SolarShare needs to buy the most competitive priced equipment and apply the latest technology. SolarVu lets them monitor any vendor's inverters and compare different site design configurations. Using [SolarVu Smart Enterprise](#) they can compare tracker performance to fixed mount to determine the best design for their next projects.

Mike Brigham, SolarShare president, explains to Solar Bonds investors, how [Morgan Savanna dual axis trackers](#), selected for their next 11 500kW projects, will produce the best ROI. Reports from SolarVu Smart Enterprise will be used to compare performance of their tracker and fixed mount sites.
